Submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.
Submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.
-!- SUBUNIT: THE BASAL BODY CONSTITUTES A MAJOR PORTION OF THE FLAGELLAR ORGANELLE AND CONSISTS OF FOUR RINGS (L,P,S, AND M) MOUNTED ON A CENTRAL ROD. THE ROD CONSISTS OF ABOUT 26 SUBUNITS FLGG IN THE DISTAL PORTION, AND FLGB, FLGC AND FLGF ARE THOUGHT BUILD UP THE PROXIMAL PORTION OF THE ROD WITH ABOUT 6 SUBUNITS EACH (BY SIMILARITY).
                                                                                                                  Flagella.

                                                                                                                                                                                                                           Claim
                                                                                The invention relates to new chemical compounds which are peptides of formulae XXXX (I), XXNXZ (II) and XINXXX (III), and peptides comprising the sequences (I), (II) or (III) and containing not greater than 8 amino acid residues. In the formulae, X is any amino acid with a cationic side chain, N and Z are neutral amino acids, and two of X1, X2 and X3 are amino acids with an anionic side chain and the third is an amino acid with an anionic or neutral side chain and the third is an amino acid with an anionic or neutral side chain. Also new is the peptide Gly-Ser-Asn-Lys-Gly-Ala-Ile-Ile-Gly-Leu-Met. The present sequence is the latter undecapeptide which represents amino acids 25-35 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's
                                         beta-amyloid peptide A-beta.
The peptides inhibit the binding of glycosaminoglycans and/or proteoglycans to A-beta peptide and hence can be used for preventing the
                                                                                                                                                                                                                                                                    Treating Alzheimer's disease by using cpds.
                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                                                                                           Brunden KR,
                                                                                                                                                                                                                                                                                                                                                                                  31-AUG-1993;

It has been shown to promote nuerite outgrowth, generate CC reactive oxygen intermediates, induce cellular oxidant stress, lead to CC neuronal cytotoxcity, and promote microglial activation. The present CC peptide, which comprises amino acids: 25-35 of the amyloid beta peptide, cc is used in a pharmaceutical composition. This composition comprises an agent capable of inhibiting interaction of an amyloid beta peptide with CC a receptor for advanced glycosylation end product and a carrier. A CC method for inhibiting interaction of amyloid beta peptide with CC a receptor for advanced glycosylation end product and a carrier. A CC thibiting the interaction between the amyloid beta peptide with a receptor for advanced glycosylation can be used for inhibiting CC thibiting the interaction between the amyloid beta peptide and the creceptor for advanced glycosylation can be used for inhibiting CC degeneration of a neuronal cell, inhibiting aggregation of an amyloid beta peptide fibril on a cell, inhibiting aggregation of amyloid beta peptide fibril on a cell, inhibiting aggregation of amyloid beta peptide on the surface of a cell, inhibiting affiltration of a microglial cell by amyloid beta peptide. The methods can be used for treating e.g. CC diabetes, Alzheimer's Disease, senility, renal failure, hyperlipidemic catherosclerosis, neuronal cytotoxicity, Down's syndrome, dementia amylotion of amyloid beta peptide. The methods can be deed contraction of amyloid beta peptide. The methods can be deed contraction dementia amylotomy syndrome, dementia contraction syndrome syndrome syndrome.
                                                                                                                                                                                                                                                                                         δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                         В

Such peptides can be used in the treatment of diseases associated with neurotoxic aggregates of beta-AP specifically Alzheimer's disease. The peptides are administered at 0.001-1000 (especially 0.2-20) mg/kg, by injection and orally, or from slow-release implants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibition of aggregation of, e.g. beta-amyloid peptide - by administering decoy peptide or other calcium-influx inhibitor useful for, e.g. treating Alzheimer's disease

       Sequences AAW81466 to AAW81476 represent synthetic amyloid beta (Abeta) peptides. The invention provides a process for treating a synthetic Abeta peptide that comprises dissolving the peptide in a deoxygenated solvent selected from trifluoroethanol, hexafluorocyclohexane, dimethyl sulphoxide, morpholinopropanesulphonic acid, dimethylformamide and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence was used in the development of a novel in vitro screening assay for agents capable of affecting the deposition of beta-amyloid peptide (BAP) on tissue. The method comprises contacting a silk sample with labelled BAP, optionally in the presence of a test agent, detecting the amount of label bound to the silk and assessing the effect of the agent on the deposition of BAP. Agents that inhibit binding of BAP to silk are potentially useful for treating amyloidosis diseases, especially Alzheimer's disease.
                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                Synthetic.
                                                                                                                                                                                                                                                                                                                                   Synthetic amyloid beta (Abeta)
                                                                                                                                                                                                                                                                                                                                                                               AAW81470;

                                  This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts with a range of physiologically and pathophysiologically relevant ligands when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                solution at 20-65 deg. C for 0.5-4 hour, and removing the solvent by 'evaporative deposition', in 5-10 minutes. Synthetic amyloid beta peptides are useful as research tools for studying neurotoxicity resulting from Abeta peptide -enhanced free-radical production. The treatment increases the activity of the synthetic Abeta peptides in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17-MAY-1999;
10-SEP-1999;
15-OCT-1999;
                                                                                                                                                                       peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from pendes activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.
                                                                                                                                                                                                                                                       The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a period of the contractive amino acid region (IV).
                                                                                         intracellular uptake and interference with physiological process: AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 504; 733pp;

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases and suggestificity as bonding to large molecules decreases. AAB90829 to AAB9241 represent peptides which can be used in the ceeping the period of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-MAY-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                           ARM64488-W64517 are decoy peptides that bind to a neurotoxic beta-amyloid peptide (beta-AP) and reduces the ability of beta-AP's to form aggregates that increase calcium influx into neuronal cells. Such peptides can be used in the treatment of diseases associated with neurotoxic aggregates of beta-AP specifically Alzheimer's disease. The peptides are administered at 0.001-1000 (especially 0.2-20) mg/kg, by injection and orally, or from slow-release implants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibition of aggregation of, e.g. beta-amyloid peptide - by administering decoy peptide or other calcium-influx inhibitor, useful for, e.g. treating Alzheimer's disease

                                                                                                                                                                 The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity CC in vivo for the treatment of various disorders. Endogenous therapeutic compises are not suitable as drug candidates as they require frequent cadministration due to rapid degradation by peptidases in the body. CC modifying and attaching therapeutic peptides to albumin prevents or CC reduces the action of peptidases to increase length of activity (half CC life) and specificity as bonding to large molecules decreases CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the CX CX exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a creactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half infe) and specificity as bonding to large molecules decreases.
                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reactive group (II) (e.g. succinimity) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes.

The present invention describes a modified therapeutic peptide (I)
C comprising a therapeutically active amino acid region (III) and a
CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
CC a less therapeutically active amino acid region (IV), which covalently
CC bonds with amino/hydroxyl/thiol groups on blood components to form a
CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
CC factors and neurotransmitters, to protect them from peptidase activity
CC in vivo for the treatment of various disorders. Endogenous therapeutic
CC peptides are not sultable as drug candidates as they require frequent
CC administration due to rapid degradation by peptidases in the body.
CC Modifying and attaching therapeutic peptides to albumin prevents or
CC reduces the action of peptidases to increase length of activity (half
CC life) and specificity as bonding to large molecules decreases
CC intracellular uptake and interference with physiological processes.
CC AAB90829 to AAB9241 represent peptides which can be used in the
CC exemplification of the present invention.
